DETAILED ACTION

Claim Objections

1. Claims 10-14 are objected to because of the following informalities:

The claim numbering needs to be updated.

Appropriate correction is required.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 9-14 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Specifically, in claim 9 in the last line, "masses" is indefinite because it is not clear to one of ordinary skill if the first mass and second mass are coupled by the spring to the reference mass.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 9-14 are rejected under 35 U.S.C. 102(b) as being anticipated by Endo et al. (US 5267633).

Endo et al. disclose a spring/mass vibratory force coupler (Fig. 1) with variable damping and variable spring stiffness for coupling masses to a reference mass including a first mass (the engine) coupled to a second mass (the chassis) via a first spring (a first spring is inherent to the disclosure of Endo et al. since the engine is mounted to the chassis at multiple locations) and a second spring 3 independent of the first spring, arranged in parallel, a damper 9, arranged between the second spring and the first mass wherein a damping function of the damper may be varied based on an application of a voltage to an electrorheological or magnetorheological fluid contained therein so as to provide a continuously variable spring stiffness, wherein when the damping function of the damper is turned off, the second spring couples the masses without any damping function (see col. 7 line 31).

Re claim 10, see masses 1, 2, 4, or 5.

Re claim 11, see coupling element 58.

Re claim 12, see masses 1, 2, 4, or 5.

Re claim 13, see Fig. 1.

Re claim 14, see col. 6 line 31.

Response to Arguments

6. Applicant's arguments with respect to claims 9-14 have been considered but are moot in view of the new ground(s) of rejection.
